Will electricity storage capacity grow by 2030?

With growing demand for electricity storage from stationary and mobile applications, the total stock of electricity storage capacity in energy terms will need to grow from an estimated 4.67 terawatt-hours (TWh) in 2017 to 11.89-15.72 TWh (155-227% higher than in 2017) if the share of renewable energy in the energy system is to be doubled by 2030.

Is electricity storage an economic solution?

Electricity storage is currently an economic solution of-grid in solar home systems and mini-grids where it can also increase the fraction of renewable energy in the system to as high as 100% (IRENA,2016c). The same applies in the case of islands or other isolated grids that are reliant on diesel-fired electricity (IRENA,2016a; IRENA,2016d).

The capital cost of an energy storage system has two components: an energy cost (\$ GWh -1) and a power cost (\$ GW -1). Sometimes these components are conflated into a single number (e.g. \$ GW -1) by using a fixed storage time such as 6 h. This can sometimes be useful when comparing similar systems but is misleading when comparing ...
