High-Temperature Performance of Lithium-Ion Batteries: A Focus on 18650 and 21700 Cells. Introduction. Lithium-ion batteries (LIBs) have revolutionized the portable electronics industry and are increasingly being adopted for electric vehicles (EVs) and energy storage systems (ESS).

The low-temperature performance of Li-ion batteries (LIBs) has important impacts on their commercial applications. Besides the metallic lithium deposition, which is regarded as one of the main failure mechanisms of the LIBs at low temperatures, the synergistic effects originating from the cathode, anode, electrolyte, and separators to the batteries are still not clear.

Due to its increased cell size, LIB 21700 (Lithium-ion battery) format has surpassed the existing formats as it offers larger capacity and higher energy density. However, the battery pack's extended life and appropriate performance greatly relies on the temperature. Therefore, the thermal performance assessment of LIBS is quite essential.

Particularly in high-altitude operations, UAVs impose even higher requirements for battery stability and low-temperature adaptability. Against this backdrop, Far East Battery, a subsidiary of Far East Smarter Energy Co., Ltd.
