In China, power sources include thermal power, the conventional hydropower, the pumped storage, wind power, nuclear power, and other power sources (e.g. solar power, tidal power and geothermal power). Their compositions in the installed capacity and energy generation of power source are shown in Table 1 (China

mainland only) [6].

(3) Energy storage for new energy generation is an important means to suppress power fluctuations. The amount of energy storage allocated depends on various factors, such as the accuracy of power production output prediction, market mechanism, energy storage investment cost and operating cost and so on.

In order to promote the deployment of large-scale energy storage power stations in the power grid, the paper analyzes the economics of energy storage power stations from three aspects of business operation mode, investment costs and economic benefits, and establishes the economic benefit model of multiple profit modes of demand-side response, peak-to-valley price ...

These applications are differentiated by two main categories: those that require large amounts of energy in the long term, and those that require high power, i.e., high rates of energy transfer. Capacitors and ...

Technologies include energy storage with molten salt and liquid air or cryogenic storage. Molten salt has emerged as commercially viable with concentrated solar power but this and other heat storage options may be limited by the need for large underground storage caverns.
