Lithium battery manufacturers can also develop new battery cell models based on customer needs. However, the existing lithium polymer battery cell models are few and cannot meet market demand. At the same time, the cost of developing new models of lithium polymer batteries is relatively high.

Does cell chemistry affect the per kWh cost of lithium-ion batteries?

The process-based cost model we construct for cylindrical lithium-ion cells shows that the cell chemistry has a significant impacton the per kWh cost of the batteries. For LMO batteries, with a low specific energy, the cylindrical cell format is too small and does not allow for the electrode thickness to increase sufficiently.
